Guest Editorial

ETFs in Canada continue to thrive

Pat Dunwoody

Canadian ETFs accumulated inflows of over \$38 Billion, making 2023 one of the best years for the ETF industry in Canada. For the last ten years, the industry has averaged 20% year over year growth. In comparison, the mutual fund industry had outflows of \$52 Billion as of Nov. 30th which has led to ETFs gaining market share now totalling almost 16% of mutual fund assets.

	2013	2023	Change
# of regular class ETFs	299	1,339	+448%
AUM	\$64B	\$383B	+598%
# of Issuers	9	40	+444%
Market share vs MF	6%	16%	+267%

For the second year in a row Fixed Income ETFs, including money market ETFs, outsold Equity ETFs.

The pace of product innovation also continued with over 140 ETFs launched in 2023. The most popular ETF mandates were covered call ETFs and Active Equity products. The pace of new launches of ETFs with ESG mandates however, slowed considerably in 2023.

The **Canadian ETF Association** believes that with Total Cost Reporting rules coming (in 2026) and other rules being adopted in the move to more transparency in the cost of buying and holding investment funds, ETFs will remain a good option for advisors and their clients. Because of these rules, and the shift to fee-based accounts, we believe that the growth of the industry is going to continue throughout 2024 and beyond.

New age strategies for the old school portfolio

Many traditional asset allocation strategies hold a mix of stocks and bonds to help investors reach their financial goals. However, some investment industry professionals caution these approaches may not be enough for some investors amid changing economic and market conditions. In this article we discuss why asset allocation can be vital to building an investment portfolio that can help investors reach their financial goals and take a deeper dive into what various asset classes and investments can bring to a portfolio.

Jonathan Needham

Vice President and Director,
ETF Distribution

TD Asset Management Inc.
(TDAM)

Higher inflation requires higher returns

Investors are often told about the importance of creating an investment plan that they can stick to through the thick and thin of their investing journey. And a key piece of any plan is an investor's asset allocation — or the mix of investments they hold within their portfolio. Now, traditional asset allocations like the 60/40 portfolio (60% stocks and 40% bonds) have historically delivered attractive risk-adjusted returns for many investors. But these days, finding the right asset mix might not be as straightforward. Inflation has been running hot and interest rates are at multi-decade highs. As a result, it may be more difficult for investors to earn

the returns they need to reach their financial goals. Simply put — higher inflation requires higher returns.

Old school portfolios

Consider that the historical success of the 60/40 portfolio and other traditional asset allocation strategies consisting of stocks and bonds alone were driven by a couple key factors:

- Higher returns than expected from both stocks and bonds due in large part to falling interest rates over time and stable growth in the economy with relatively low volatility over the long term
- The relatively low correlation between the performance of stocks and bonds, which led to high risk-adjusted returns

Although we feel stocks and bonds are still the bedrock of a diversified asset allocation strategy, we also believe market fundamentals have changed to some degree. For example, economic growth has been much more volatile in recent years and inflation has trended much higher than long-term historical averages. If these trends persist, we may experience several different market envi-

ronments and more variability in the returns of stocks and bonds. This may also necessitate more active and tactical management of a portfolio to help drive risk-adjusted returns. Therefore, investors may want to consider additional diversification through new investment options within their asset allocation to help drive returns higher during unpredictable times.

Options for the "new" traditional portfolio

So, what are some examples of investments that can help bring additional diversification to an asset allocation strategy? There are several different types of alternative investments to consider, including:

Foreign currencies - Various currencies have higher or lower correlations to different parts of the business cycle which can help diversify a portfolio. For example, the Canadian dollar tends to be highly correlated to the business cycle because of the Canadian economy's reliance on the commodities industry.

Options - Options are the right, but not the obligation to buy or sell an asset (typi-

cally a stock or ETF) at a particular price and time in the future. Their value is determined on an uncertain future, so investors effectively turn price volatility into an investible asset class.

Hybrids - These products are a blend of equity and fixed income that tend to offer a stable income yield and downside protection, but with some potential for upside risk. Two examples are convertible securities such as preferred shares and Special Purpose Acquisition Companies (SPACs).

Commodities - These are the raw materials used in the production of all sorts of products. Investors essentially speculate on the direction of a commodity's price through investment vehicles such as futures contracts or investment funds.

Real estate and infrastructure - Commercial and industrial properties and infrastructure are fixed assets that offer a key service and may be present in desirable locations. Real estate tends to offer relatively stable income through rental agreements and may also offer exposure

Continued on page 6

New age strategies for the old school portfolio

Continued from page 5

to economic trends such as urbanization or infrastructure upgrades. Infrastructure (e.g., roads, airports, utilities) can provide several strategic benefits to investors over a full market cycle including steady income generation, increased diversification and access to a growing market.

TDAM delivers on the options

TDAM has a broad and extensive lineup of ETFs, to help you construct a well-diversified portfolio in today's changing market and economic environment. For those that want to take a hands-off approach, consider asset allocation ETFs. A single ticket solution that can get you diversified exposure to stocks and bonds. For instance, **TD ETF Portfolios** are all-in-one solutions designed for investors who are looking for a low-cost and efficient way to invest and lack the time or expertise to pick individual securities. You can choose from three different options with differing allocations to equities and fixed income depending on your risk profile and investment horizon. For instance, a 30%

equity and 70% fixed income allocation is considered more conservative, suitable for a short to mid-term horizon, while a 90% equity and 10% fixed income mix is more aggressive and suitable for a mid to long-term horizon. For those wanting to do it themselves, consider a "core and explore" strategy.

"Core and explore" is a method of portfolio construction where an investor buckets their investments into two groups, the core which typically consists of passive investments and explore which tends to consist of more active strategies. This gives an investor more control of how they invest and can increase the risk/return profile of a portfolio. Percentage allocations to each group will depend on the investor's tolerance for risk, investment horizon and market outlook. The core allocation is meant to provide stability and long-term growth, while the explore allocation aims to generate higher returns and enhance overall portfolio performance.

Core

TDAM offers a plethora of low cost, passively managed ETFs for portfolios with exposure to Canadian, U.S. or international markets. For the equity

component, investors could utilize ETFs that track some of the major stock markets in the world, with exposure to some of the biggest companies and blue-chip names most people are familiar with. These types of ETFs will help provide the potential for growth as well as stability obtained through broad diversification. For the fixed income allocation, an investor can choose between investment grade government and corporate bond exposure that helps provide diversification and income to portfolios. Some core options on the equity side from TDAM include **TD U.S. Equity Index ETF (TPU)**, **TD Canadian Equity Index ETF (TTP)** and **TD International Equity Index ETF (TPE)**. For fixed income, investors can choose the **TD Canadian Aggregate Bond Index ETF (TDB)** which provides broad exposure to high quality investment grade government and corporate debt.

Explore

Once the core is established, the more tactical investment options can be added. The main objective for the explore allocation is to generate returns above a benchmark and could reflect the investor's short-term expectations or views in certain sectors

or geographies, like real estate, infrastructure, commodities and even fixed income. The explore portion of the portfolio typically contains investments that have lower correlations to traditional asset classes and sometimes higher volatility. Some explore options from TDAM include **TD Active Global Infrastructure Equity ETF (TINF)**, **TD Global Carbon Credit Index ETF (TCBN)**, **TD Active Preferred Share ETF (TPRF)**, **TD Q U.S. Small-Mid Cap Equity ETF (TQSM)** and **TD Select Short Term Corporate Bond Ladder ETF (TCSB)**.

The evolution of the traditional portfolio

The world has changed and so has the return outlook for major asset classes and the relationship between them. New techniques and asset classes have enabled an evolution in portfolio construction with new and innovative solutions that are better aligned with client goals and provide higher returns, with improved risk profiles. To see what ETF options are available to you, download our ETF Product Guide, available on our website **TD.com/etfs**.

Bonds are back en vogue

Today's fixed income opportunities

Fixed income, especially in the current environment, offers a rare opportunity. In today's markets, where high interest rates and global economic changes are constant, the stable and reliable returns of fixed income provide an attractive option for investors who want to find a middle ground between risk and reward.

The sharp increase in interest rates shows that, after years of extremely low yields, bonds offer a strong and distinctive opportunity to benefit from both income and capital growth—a reliable and proven diversifier for any active portfolio.

While fixed income investors have faced many difficulties in the past few years, the situation has also created exciting opportunities for them today. First, investors can now lock in bond yields that are higher than they have been in the last ten years. Additionally, many segments of the fixed-income market are now valued favourably.

Why active management now

Actively managed bond ETFs, which are often less prominent than their passive counterparts, offer the distinct advantage of strategic financial expertise. They are especially well suited for the

current market conditions as they combine professional guidance and market responsiveness. These solutions go beyond the usual limits of passive funds. Experienced portfolio managers can handle today's complex bond market with discernment. This active involvement gives investors the ability to act on opportunities in real time by

changing their portfolios to benefit from market trends and reduce risks.

An active fixed income approach can benefit from various factors that affect bond prices and market movements, such as economic and market cycles, central bank policies, and rules that apply to institutional investors. For example, an active strategy can swiftly change interest rate exposure and sector allocation through the cycle, allowing investors to hold cheaper securities and reduce exposure to costly ones while keeping a stable bond beta.

Actively putting your money to work

Active fixed income ETFs offer three dynamic features that present several potential benefits in today's financial landscape.

Flexible in the market:

Active ETFs use the same primary market mechanism as passive ETFs and trade on the same stock exchanges in the secondary market. They give investors the ability to buy and sell at any time during the day with real-time price information. This enhances liquidity and lets investors track the values of their port-

folios more accurately, a real advantage in times of market volatility.

Risk management skills:

Investors can benefit from the ability to evaluate and adapt to market risks, which can reduce the impact of possible downturns and increase the stability of their portfolio. An actively managed fixed income ETF can shift towards more reliable issuers and avoid those that might face downgrades. This can help maintain capital and returns in time of economic or market turmoil.

Possibility of higher returns:

An active management approach lets portfolio managers find and take advantage of opportunities that passive strategies may miss. By looking for the best fixed-income securities and changing allocations based on market conditions, actively managed bond ETFs can produce higher returns over time compared to their passive counterparts.

To conclude, the prospects for fixed income investors seem very attractive. With the flexibility and adaptability of actively managed ETFs, today's fixed income market offers investors opportunities to capitalize not seen in many years.

Bond ETFs climb as rates fall

Brian Bridger
CFA, FRM

Since their arrival over two decades ago, bond ETFs have become a popular way for individual investors to gain exposure to the fixed-income market. Before that, investors could buy individual bond issues; however, this was not always feasible because of the high minimum investments, low liquidity, and lack of diversification. Fixed-income mutual funds were another option that alleviated some of these issues, but at that time, these were primarily active funds that came with sales charges as well as man-

agement expense ratios (MERs) in the 1% to 2% range. Fixed-income ETFs solved these problems by packaging bonds into low-MER funds that could be bought and sold just like stocks.

As rates increased dramatically over the past two years, fixed-income products performed very poorly. This is because bond prices move inversely with the direction of interest rates. For fixed-income products, the most common metric used to measure sensitivity to changes in rates is called “duration.”

There are a few different ways to interpret duration, but the important thing to know is that the higher the duration, the more the price of a bond will fluctuate with changes in rates. In general, long-term bonds have a higher duration than short-term bonds. So, in a rising rate environment, long-term bond funds are expected to underperform short-term bond funds. As the accompanying table shows, this is exactly what has happened to Canadian bond funds across the duration spectrum.

Over the past few months, inflation has cooled, and signs have emerged that the economy is slowing down. Many investors and market participants believe that interest rates have peaked. In fact, yields at the long end of the curve have already

come down off their highs and many expect that the Bank of Canada will begin cutting the overnight rate as early as March 2024. Declining rates would be welcome news for fixed-income investors after the losses they have endured. Depending on an investor’s risk tolerance, here are three ETFs that stand to benefit from such a scenario.

iShares Core Canadian Short Term Corporate Bond Index (TSX: XSH) debuted in 2011 and is in the Canadian Short Term Fixed Income category. XSH seeks to replicate the performance of the FTSE Canada Universe + Maple Short Term Corporate Bond Index, which consists of investment-grade corporate bonds with maturities of between 1 and 5 years. It includes bonds issued by Canadian issuers as well as Maple Bonds, which are bonds issued in the Canadian market by foreign issuers. The duration is 2.6 years, and the trailing 12-month (TTM) yield is 3.2%. After losing 4.5% in 2022, XSH finished 2023 up 6.6%, gaining over 4% in the final two months of the year. The fund has an MER of 0.1% and is rated Low-risk.

BMO Aggregate Bond Index ETF (TSX: ZAG) is in the Canadian Fixed Income fund category, and was launched in 2010. It is designed to replicate the performance of the

FTSE Canada Universe Bond Index. The index is a broad measure of the Canadian investment grade fixed-income market consisting of federal, provincial, and corporate bonds. The duration is just over 7 years, and the TTM yield is 3.5%. ZAG lost 11.8% in 2022 and was on track for another poor performance in 2023, down 1.1% through Oct 31. But a strong November and December propelled this fund to a gain of 6.7% for the year. The fund is rated Low-risk and has an MER of just 0.09%.

Vanguard Canadian Long-Term Bond Index ETF (TSX: VLB) debuted in 2017 and is in the Canadian Long Term Fixed Income category. This ETF seeks to track the Bloomberg Barclays Global Aggregate Canadian 10+ Year Float Adjusted Bond Index, a market-capitalization-weighted index of investment-grade government and corporate fixed-income securities issued in Canada with maturities of at least 10 years. The duration of VLB is close to 15 years, and it has yielded 3.7% on a TTM basis. 2022 was particularly painful for this fund, which fell 21.8%. It looked like more losses were in store for 2023 until it shot up 15% in the final two months, finishing the year with a gain of 9.2%. VLB has an MER of 0.17% and a risk rating of Low to Medium.
